

WHAT IS CLAIMED IS:

1. An image output apparatus comprising:

an image output section that outputs an image in
5 accordance with received image data, the image output
section having a plurality of output modes mutually
different from one another in output quality; and

a correcting section that transfers image data to
the image output section upon application of processing of
10 detection and correction of a predetermined inconvenience
as to eyes in the image represented by the image data to
the image data, or transfers image data to the image output
section without application of processing of detection and
correction of the predetermined inconvenience to the image
15 data, in accordance with a situation as to whether an
associated output mode of the image output section is a
predetermined output mode which is relatively high in the
output quality among the plurality of output modes.

20 2. An image output apparatus according to claim 1,
wherein the output quality is a number of pixels
constituting an image.

3. An image output apparatus according to claim 1,
25 wherein the output quality is a display time for an image.

4. An image output apparatus according to claim 1,

wherein the correcting section applies, as the processing,
a red eye correcting processing in which red eyes in the
image are detected and corrected.

5 5. An image output program storage medium storing
an image output program, the image output program
comprising:

an image output section that outputs an image in
accordance with received image data, the image output
10 section having a plurality of output modes mutually
different from one another in output quality; and

a correcting section that transfers image data to
the image output section upon application of processing of
detection and correction of a predetermined inconvenience
15 as to eyes in the image represented by the image data to
the image data, or transfers image data to the image output
section without application of processing of detection and
correction of the predetermined inconvenience to the image
data, in accordance with a situation as to whether an
20 associated output mode of the image output section is a
predetermined output mode which is relatively high in the
output quality among the plurality of output modes.

6. A server apparatus that transmits received
25 image data to a client apparatus that outputs an image in
accordance with the received image data, the server
apparatus comprising:

an image correcting section that detects and corrects a predetermined inconvenience as to eyes in the image represented by the image data;

an output quality obtaining section that obtains output quality of an image of the client apparatus; and

an image data transmission section that transfers image data corrected in the inconvenience in the image correcting section to the client apparatus, or transfers image data not corrected in the inconvenience to the client apparatus, in accordance with a situation as to whether the output quality obtained in the output quality obtaining section is higher than a predetermined quality.

7. An image output system comprising a plurality of client apparatuses each outputting an image in accordance with received image data, and a server apparatus that transmits image data to the client apparatuses,

wherein the plurality of client apparatuses include a plurality of types of client apparatuses that output images having output qualities mutually different from one another, and

wherein the server apparatus comprises:

an image correcting section that detects and corrects a predetermined inconvenience as to eyes in the image represented by the image data;

an output quality obtaining section that obtains output quality of an image of the client apparatus; and

an image data transmission section that transfers image data corrected in the inconvenience in the image correcting section to the client apparatus, or transfers image data not corrected in the inconvenience to the client apparatus, in accordance with a situation as to whether the output quality obtained in the output quality obtaining section is higher than a predetermined quality.
